<mark>Autumn 2 – Rep</mark>	<mark>2 – Representations</mark>		
Knowledge	Working in the Cartesian Plane (3 weeks)	Representing Data (2 weeks)	Tables and Probability (1 week)
Rationale	Building on their knowledge of coordinates from KS2, students will look formally at algebraic rules for straight lines, starting with lines parallel to the axes and moving on to the more general form. They can explore the notions of gradient and intercepts, but the focus at this stage is using the equations to produce lines rather than interpretation of m and c from a given equation; this will be covered in Year 9. Use of technology to illustrate graphs should be embedded. Appreciating the similarities and differences between sequences, lists of coordinates and lines is another key point. If time allows, we may also explore nonlinear graphs and midpoints of line segments.	Students are introduced formally to bivariate data and the idea of linear correlation. They extend their knowledge of graphs and charts from Key Stage 2 to deal with both discrete and continuous data.	Building from the Year 7 unit, this short block reminds students of the ideas of probability, in particular looking at sample spaces and the use of tables to represent these.
National Curriculum Content Covered (Bold type Indicates NC Content Revisited from Y7)	move freely between different numerical, algebraic, graphical and diagrammatic representations develop algebraic and graphical fluency, including understanding linear (and simple quadratic) functions make connections between number relationships, and their algebraic and graphical representations substitute numerical values into formulae and expressions recognise, sketch and produce graphs of linear functions of one variable with appropriate scaling, using equations in x and y and the Cartesian plane	describe, interpret and compare observed distributions of a single variable through appropriate graphical representation involving discrete, continuous and grouped data construct and interpret appropriate tables, charts, and diagrams, including frequency tables, bar charts, pie charts, and pictograms for categorical data, and vertical line (or bar) charts for ungrouped and grouped numerical data describe simple mathematical relationships between two variables (bivariate data) in observational and experimental contexts and illustrate using scatter graphs use language and properties precisely to analyse probability and statistics	record, describe and analyse the frequency of outcomes of simple probability experiments involving randomness, fairness, equally and unequally likely outcomes, using appropriate language and the 0-1 probability scale generate theoretical sample spaces for single and combined events with equally likely, mutually exclusive outcomes and use these to calculate theoretical probabilities use language and properties precisely to analyse probability and statistics
Connections to Other Previous National Curriculum Content in Y7 (Statutory)	- Generate terms of a sequence from a term-to-term rule - Use and interpret algebraic notation - Make and test conjectures about patterns and relationships - Recognise arithmetic sequences - Generate terms of a sequence - Use a calculator and other technologies to calculate results accurately and then interpret them appropriately	Use formal written methods, applied to positive integers and decimals Recognise and use relationships between operations including inverse operations	Understand that the probabilities of all possible outcomes sum to 1 Enumerate sets and unions/intersections of sets systematically, using tables, grids and Venn diagrams Appreciate the infinite nature of the sets of integers, real and rational numbers

Building on their understanding of equivalence from Year 7, students will explore expanding over a single bracket and factorising by taking out common factors. If time allows, pupils will also explore expanding two binomials. All students will revisit and extend their knowledge of solving equations, now to include those with brackets and, if time allows, with unknowns on both sides. Bar models will be recommended as a tool to help students make sense of the maths. Students will also learn to solve formal inequalities for the first time, learning the meaning of a solution set and exploring the similarities and differences compared to solving equations. Emphasis is placed on both forming and solving equations rather than just looking at procedural methods of finding solutions. National Curriculum Content Covered (Bold type Indicates NC Content Revisited from Y7) **National Curriculum end of a solution smathematical particular inequalities, terms and factors **substitute numerical values into formulae and expressions to maintain equivalence by: collecting like terms **multiplying a single term over a bracket** **a taking out common factors** **expanding prove a single bracket and factorising by taking out common factors in a procedural methods of finding solutions. Spring 2 –	Developing Number		
Knowledge	Fractions and Percentages (2 weeks)	Standard Index Form (2 weeks)	Number Sense (1 week)
Rationale	This block focuses on the relationships between fractions and percentages, including decimal equivalents, and using these to work out percentage increase and decrease. Students also explore expressing one number as a fraction and percentage of another. Both calculator and non-calculator methods are developed throughout to support students to choose efficient methods. Financial maths is developed through the contexts of e.g. profit, loss and interest. If time allows, pupils also look at finding the original value given a percentage or after a percentage change.	If time allowed, students may have already briefly looked at standard form in year 7 and now this knowledge is introduced to all students, building from their earlier work on indices last term. The use of context is important to help students make sense of the need for the notation and its uses. If time allows, pupils also look at a basic introduction to negative and fractional indices.	This block provides a timely opportunity to revisit a lot of basic skills in a wide variety of contexts. Estimation is a key focus and the use of mental strategies will therefore be embedded throughout. We will also use conversion of metric units to revisit multiplying and dividing by 10, 100 and 1000 in context. If time allows, this is extended to look at the conversion of area and volume units, as well as having an extra step on the use of error notation. We also look explicitly at solving problems using the time and calendar as this area is sometimes neglected leaving gaps in student knowledge.
National Curriculum Content Covered (Bold type Indicates NC Content Revisited from Y7)	develop their use of formal mathematical knowledge to interpret and solve problems, including in financial mathematics work interchangeably with terminating decimals and their corresponding fractions define percentage as 'number of parts per hundred', interpret percentages and percentage changes as a fraction or a decimal, interpret these multiplicatively, express one quantity as a percentage of another, compare two quantities using percentages, and work with percentages greater than 100% interpret fractions and percentages as operators	 use integer powers and associated real roots (square, cube and higher), recognise powers of 2, 3, 4, 5 and distinguish between exact representations of roots and their decimal approximations interpret and compare numbers in standard form A x 10^n, 1 ≤ A < 10, where n is a positive or negative integer or zero 	 use standard units of mass, length, time, money and other measures, including with decimal quantities round numbers and measures to an appropriate degree of accuracy [for example, to a number of decimal places or significant figures] use approximation through rounding to estimate answers and calculate possible resulting errors expressed using inequality notation a < x ≤ b
Connections to Other Previous National Curriculum Content in Y7 (Statutory)	Consolidate their understanding of the number system and place value to include decimals, fractions Move freely between different numerical representations [for example, equivalent fractions, fractions and decimals] Extend their understanding of the number system; make connections between number relationships Express one quantity as a fraction of another, where the fraction is less than 1 and greater than 1 Use the four operations, including formal written methods, applied to integers, decimals, proper and improper fractions	 Understand and use place value for decimals, measures and integers of any size Order positive and negative integers, decimals and fractions; use the number line as a model for ordering of the real numbers; use the symbols =, ≠,<, >, ≤, ≥ 	Consolidate their understanding of the number system and place value to include decimals Understand and use place value for decimals, measures and integers of any size

Summer 1 –	Developing Geometry		
Knowledge	Angles in Parallel Lines and Polygons (3 weeks)	Area of Trapezia and Circles (2 weeks)	Line Symmetry and Reflection (1 week)
Rationale	This block builds on KS2 and Year 7 understanding of angle notation and relationships, extending all students to explore angles in parallel lines and thus solve increasingly complex missing angle problems. Links are then made to the closely connected properties of polygons and quadrilaterals. The use of dynamic geometry software to illustrate results is highly recommended. If time allows, pupils will also develop their understanding of the idea of proof. If time allows, pupils will also look start to explore constructions with rulers and pairs of compasses. This key block may take slightly longer than two weeks and the following blocks may need to be adjusted accordingly.	Some students may have met the formulae for the area of a trapezium in Year 7; this knowledge is now extended to all students, along with the formula for the area of a circle. A key aspect of the unit is choosing and using the correct formula for the correct shape, reinforcing recognising the shapes, their properties and names and looking explicitly at compound shapes.	The teaching of reflection is split from that of rotation and translation to try and ensure students attain a deeper understanding and avoid mixing up the different concepts. Although there is comparatively little content in this block, it is worth investing time to build confidence with shapes and lines in different orientations. Students can revisit and enhance their knowledge of special triangles and quadrilaterals and focus on key vocabulary such as object, image, congruent etc. Rotation and translations will be explored in Year 9
National Curriculum Content Covered (Bold type Indicates NC Content Revisited from Y7)	apply the properties of angles at a point, angles at a point on a straight line, vertically opposite angles understand and use the relationship between parallel lines and alternate and corresponding angles derive and use the sum of angles in a triangle and use it to deduce the angle sum in any polygon, and to derive properties of regular polygons use the standard conventions for labelling the sides and angles of triangle ABC derive and illustrate properties of triangles, quadrilaterals, circles, and other plane figures [for example, equal lengths and angles] using appropriate language and technologies derive and use the standard ruler and compass constructions (if time allows)	derive and apply formulae to calculate and solve problems involving: perimeter and area of triangles, parallelograms, trapezia calculate and solve problems involving: perimeters of 2-D shapes (including circles), areas of circles and composite shapes Substitute numerical values into formulae and expressions, including scientific formulae	describe, sketch and draw using conventional terms and notations: points, lines, parallel lines, perpendicular lines, right angles, regular polygons, and other polygons that are reflectively and rotationally symmetric identify properties of, and describe the results of reflections applied to given figures
Connections to Other Previous National Curriculum Content in Y7 (Statutory)	Select and use appropriate calculation strategies to solve increasingly complex problems Use formal written methods, applied to positive integers and decimals Derive and apply formulae to calculate and solve problems involving perimeter	Use formal written methods, applied to positive integers and decimals Select and use appropriate calculation strategies to solve increasingly complex problems	Use language and properties precisely to analyse 2-D shapes
Assessment	5.	aths/ White Rose Maths skills check at the end of each unit (3 du	rring this period)
Homework		Numeracy Ninja Booklets – core calculation/mental skills

Knowledge	The Data Handling Cycle (4 weeks)	Measures of Location (2 weeks)
Rationale	Much of the statistics content in Key Stage 3 is a continuation of that studied at primary school, and many of the charts and graphs in this block have been used in Year 7 and earlier in Year 8. A particular focus is using charts to compare different distributions. We also explore when graphs may be misleading, an important real-life consideration. Collection of data is also covered, including designing and criticising questionnaires. As we are covering the elements of the data handling cycle, it may well be worth delivering these steps (and some of those in the next block) through an extended project so students become aware of the pitfalls and difficulties of data collection and interpretation as well as the procedural production of graphs and charts.	Students have already met the median and the mean earlier in KS3. This block introduces the mode and also looks at when and why each average should be used. Students following the Higher strand will look at the mean from grouped and ungrouped frequency tables, and these steps may well also be accessible to the vast majority of students following the Core strand. The previous block is built on as students have the opportunity to compare distributions, use these averages and the range. We also consider outliers, considering what effect these have on all the measures studied, and whether they should be included or excluded in our calculations. Again, much of the material in the block is suitable for exploring through project work.
National Curriculum Content Covered (Bold type Indicates NC Content Revisited from Y7)	describe, interpret and compare observed distributions of a single variable through: appropriate graphical representation involving discrete, continuous and grouped data; and appropriate measures of central tendency (mean, mode, median) and spread (range, consideration of outliers) construct and interpret appropriate tables, charts, and diagrams, including: frequency tables, bar charts, pie charts, and pictograms for categorical data, and vertical line (or bar) charts for ungrouped and grouped numerical data	describe, interpret and compare observed distributions of a single variable through appropriate measures of central tendency (mean, mode, median) and spread (range, consideration of outliers)
Connections to Other Previous National Curriculum Content in Y7 (Statutory)	Use formal written methods, applied to positive integers and decimals	 Order positive and negative integers, decimals and fractions; use the number line as a model for ordering of the real numbers; use the symbols =, ≠,<, >, ≤, ≥ Understand and use place value for decimals, measures and integers of any size Use formal written methods, applied to positive integers and decimals Select and use appropriate calculation strategies to solve increasingly complex problems Substitute numerical values into formulae and expressions, including scientific formulae
Assessment	Dr Frost Maths/ White Rose Maths skills check	c at the end of each unit (2 during this period)
Homework	Numeracy Ninja Booklets – core calculation/mental skills
